Thought of the week

Economic forecasting has been an increasingly tough job due to the ever-evolving tariff landscape. A major source of confusion has been the difference between statutory (or announced) and effective tariff rates. For example, the tariff paid by importers may be 25%, but when you calculate the effective rate by dividing tariff revenues by import values, it often appears lower. This happens due to real-world complexities such as exemptions, quotas, shipping delays, and product mix shifts.

This week's chart illustrates the significant changes in both statutory and effective tariff rates since the start of the year. The gap between these rates is wide due to implementation delays and a dramatic shift in import share composition, both by product and country. Imports from China, which are subject to the highest tariffs at an estimated effective rate of 40%, have plummeted, decreasing by 24% y/y from March to May 2025. In contrast, imports from the Eurozone, now facing an effective tariff of approximately 10%, have surged, largely driven by the frontloading of products like pharmaceuticals. The data show that importers are actively seeking substitutes from other countries to circumvent these tariffs.

The terminal tariff rate is still uncertain, but a rate in the high teens is becoming more likely. The Section 232 investigations are almost complete, indicating more sectoral tariffs could be introduced, along with the already announced 50% copper tariff. Also, recent negotiations with Vietnam, which initially raised hopes for lower rates, ended with a 20% tariff on products originating in Vietnam, higher than the previously announced 10% during the 90-day pause. This outcome makes other negotiations look less promising. As a result, investors may need to be more cautious and actively manage their exposure to affected companies.
